SECURE PASSWORD

Strategies and advice.

LENGTH

A strong password should have at least 12 characters, including upper and lower case letters, numbers, and at least one symbol.

UNIQUENESS

Each account must have a unique password, do not use the same one for multiple registrations.

CONFIDENTIALITY

Don't share your passwords with anyone, not even colleagues. If you can't do without it, change it immediately after use.

NOTES

42% of organizations manage passwords with sticky cards. Do not write passwords on cards or even on digital media such as mobile phones.

MANAGER

PASSWOR

Use a password manager to store and manage your passwords. You will no longer have problems memorizing secure passwords.

2FA

Use two-factor authentication whenever possible to protect your accounts. Using two conditions to log in makes your logins much more secure.

UPDATE

Change your passwords frequently, at least every six months. There are still few systems that require PW to be updated at pre-established deadlines.

ORIGINALITY

Among the most used passwords there is still 12345 and your name! Do not include personal information, names of famous people, city, movies and general common names in passwords.
